Phase 1 design alignment

Source: Group 5 Phase 1 proposal, use case diagram, ERD, and architecture (pp. 3-7).

Student (Users.role = user)

Register or log in, view deadlines, manage personal tasks, assign an optional subject, update status, and search or filter tasks.

Administrator (Users.role = admin)

Manage user accounts and view all tasks with their owners for system oversight.

Users collection

name and **email** are entered on registration. The password input maps to **passwordHash** through future server-side hashing. The server assigns the default user role and manages identifiers and timestamps.

Tasks and Categories collections

title and **dueDate** are required. **description** is optional. **status** and **priority** use the ERD values. The optional **category** references **Categories._id**. The subject form collects **name** and optional **color**.

Navigation

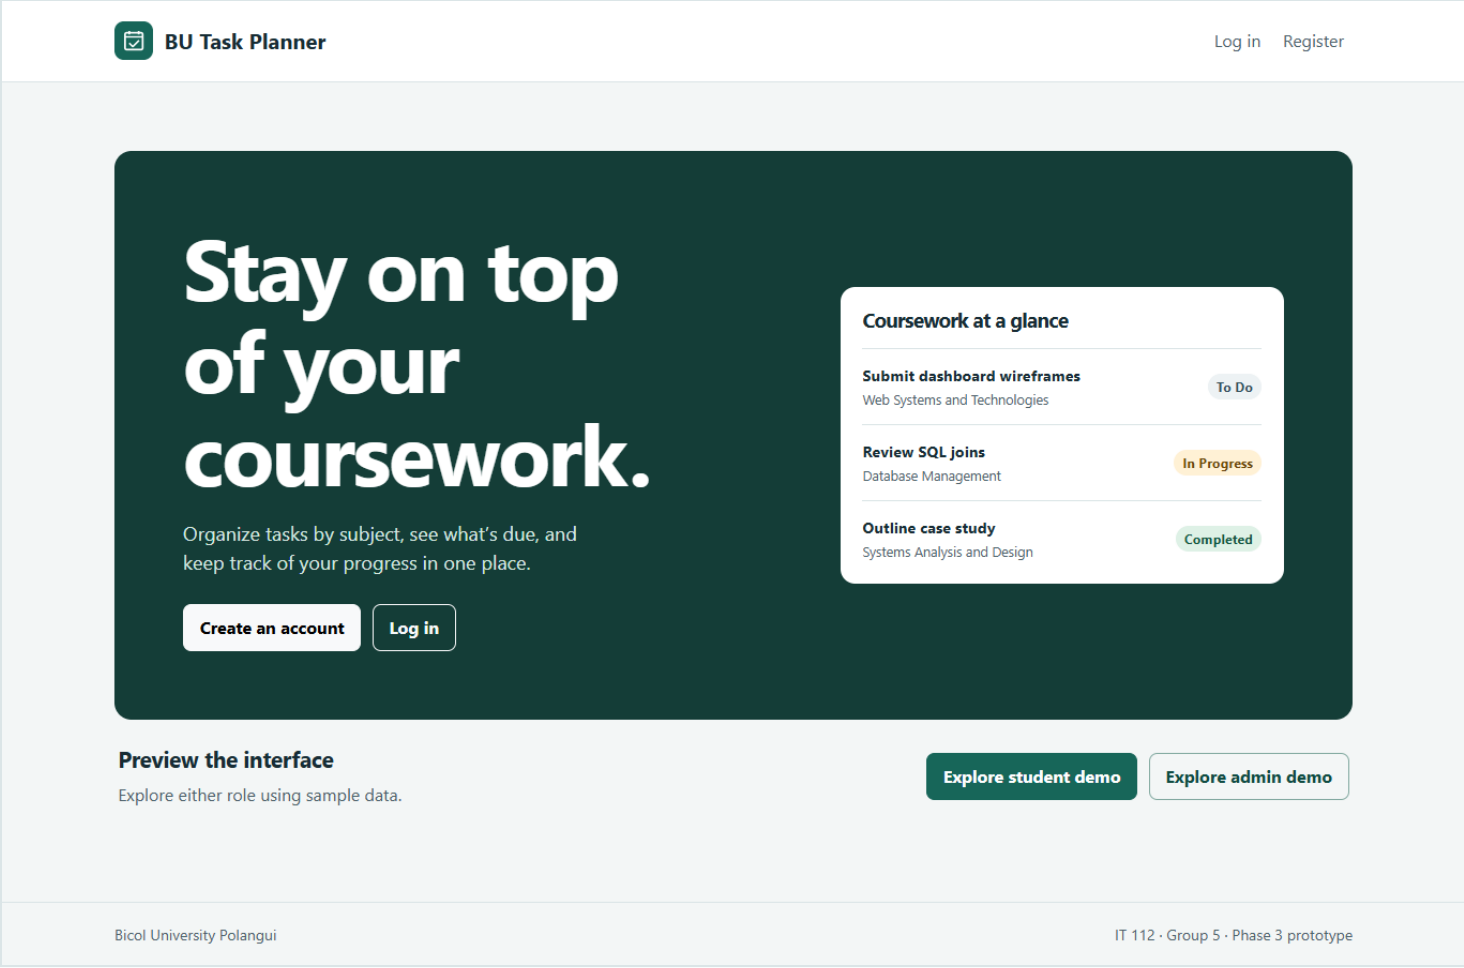

Home links to registration, login, and both sample role previews. The student dashboard links to the task list and Profile. The administrator page groups account management and task oversight.

Architecture handoff

This lab implements the browser and HTML/CSS/Bootstrap layer. A shared JavaScript submit handler marks future Fetch requests to Express. Express will validate identity, roles, ownership, and inputs before accessing MongoDB Atlas through Mongoose.

Home

frontend/index.html

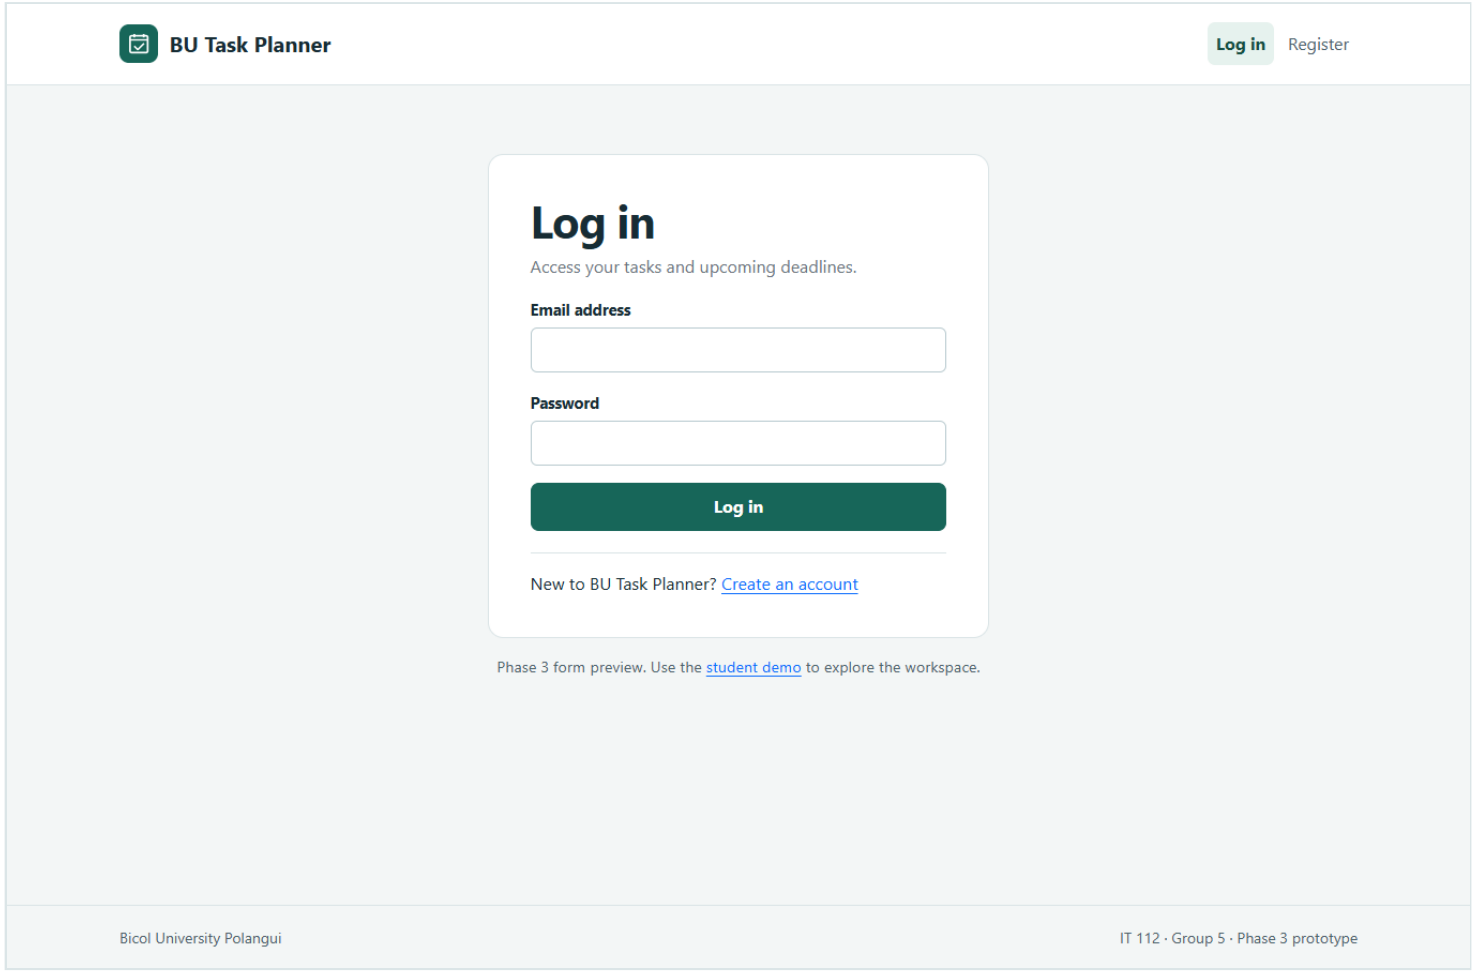

Public entry point

Registration and login links lead to the account forms. The demo links open the student dashboard or administration page.

Log in

frontend/login.html

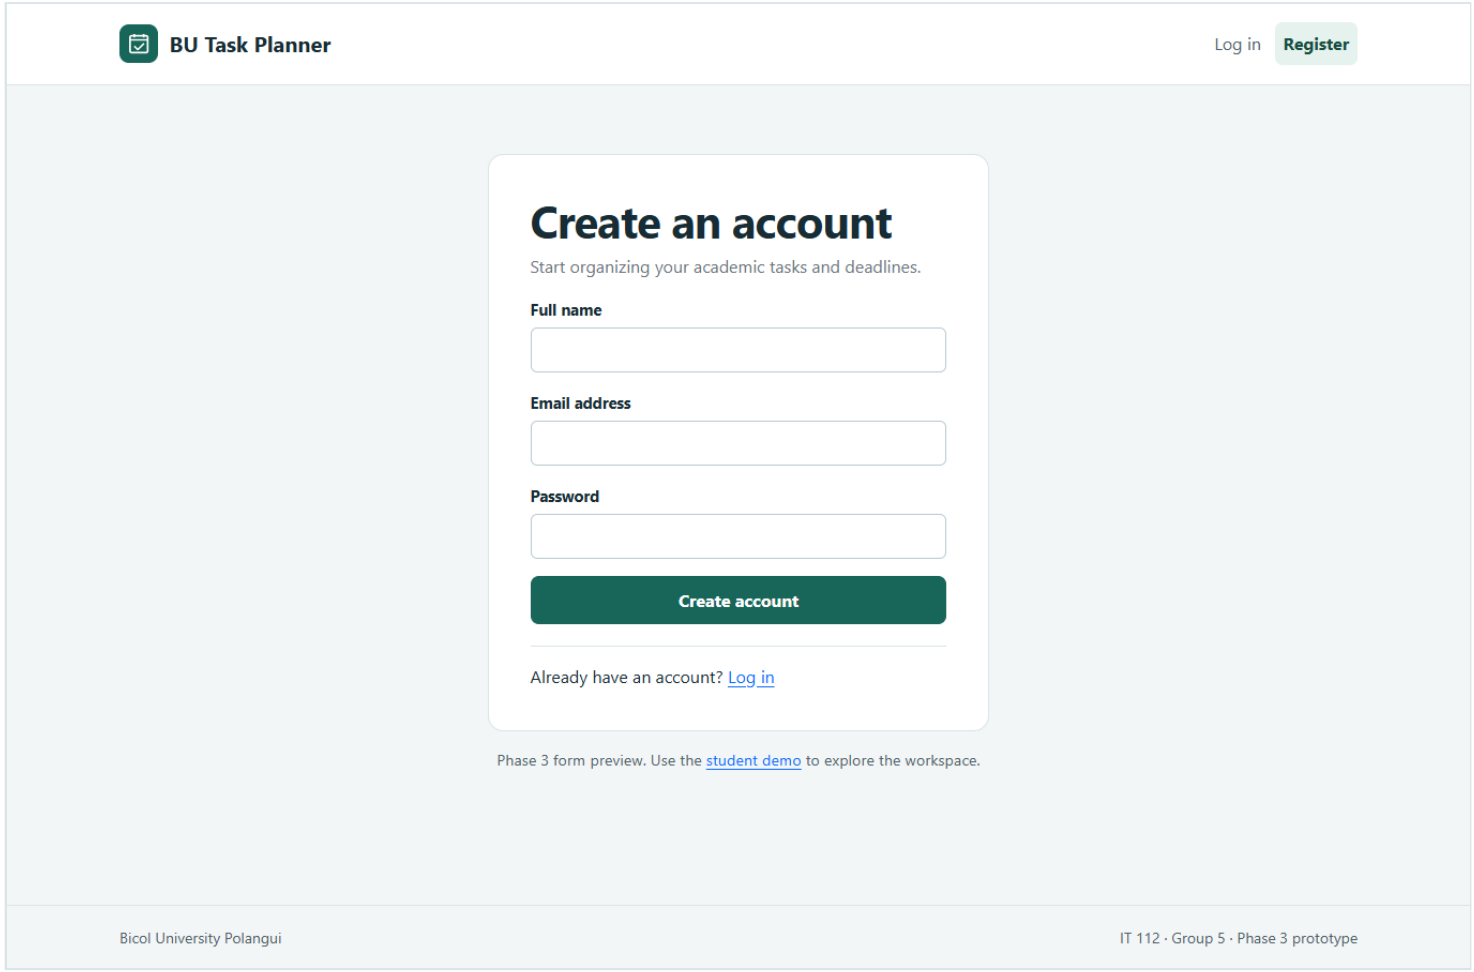

Register / log in

The form collects email and password. A future login endpoint will verify the password against Users.passwordHash and identify the role.

Register

frontend/register.html

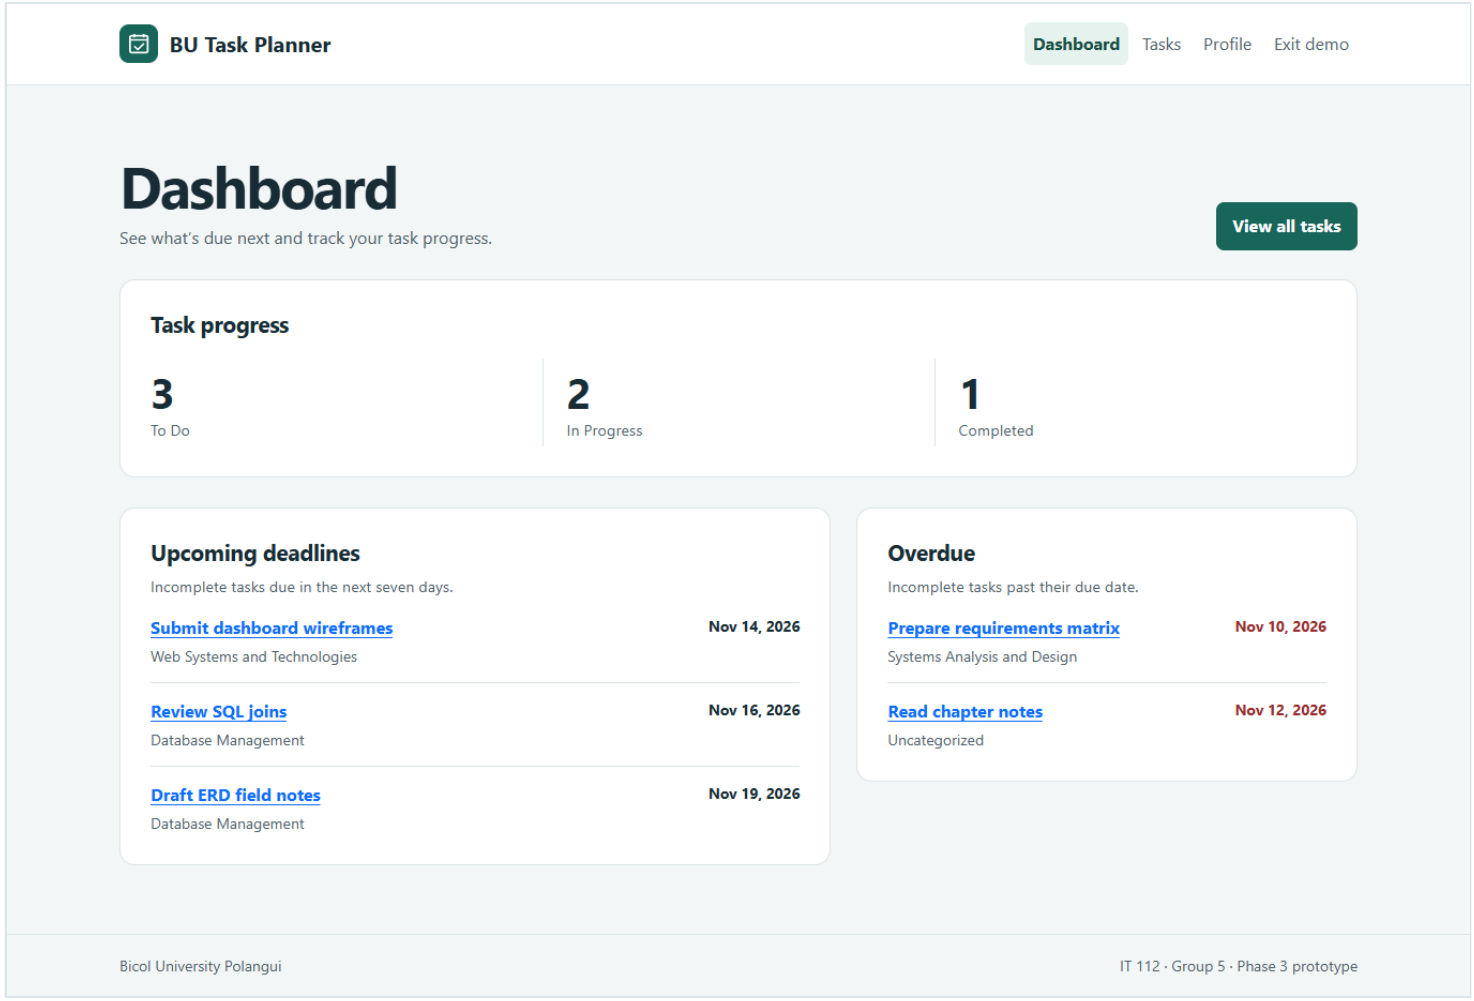

Register / log in

A student enters name, email, and password. The future API will assign the user role and manage hashing and account metadata.

Student dashboard

frontend/dashboard.html

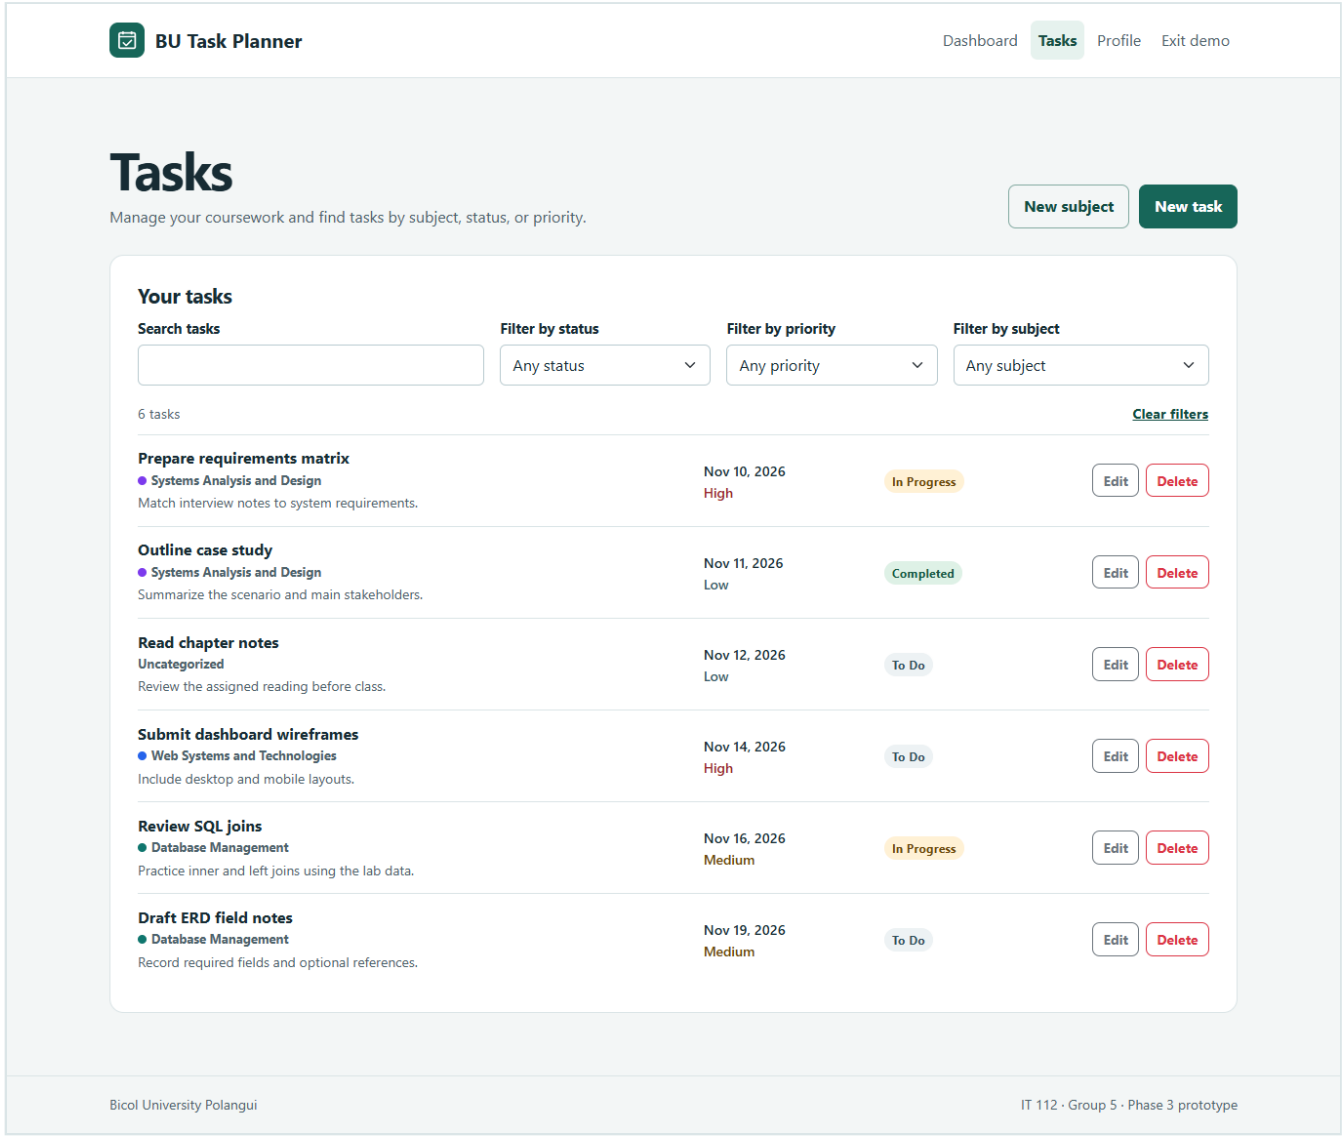

View dashboard and deadlines

Status totals use Tasks.status. The deadline cards use Tasks.dueDate to show incomplete tasks due within seven days or already overdue.

Tasks

frontend/tasks.html

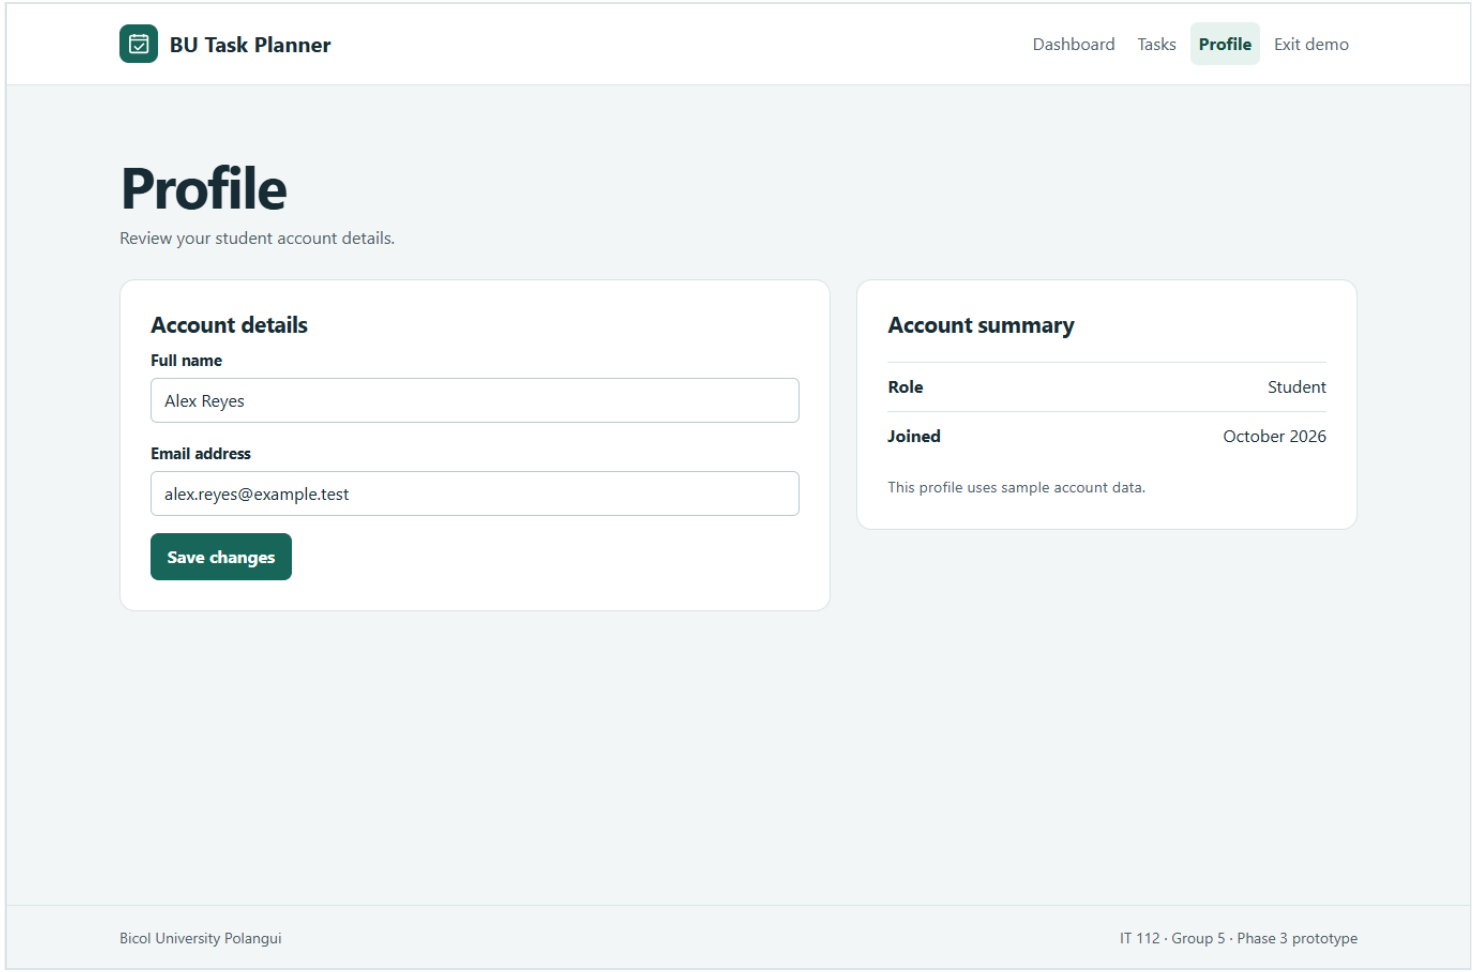

Manage, search, and filter personal tasks

Task rows show title, description, subject, due date, priority, and status. Keyword, status, priority, and subject filters work on the sample records.

Profile

frontend/profile.html

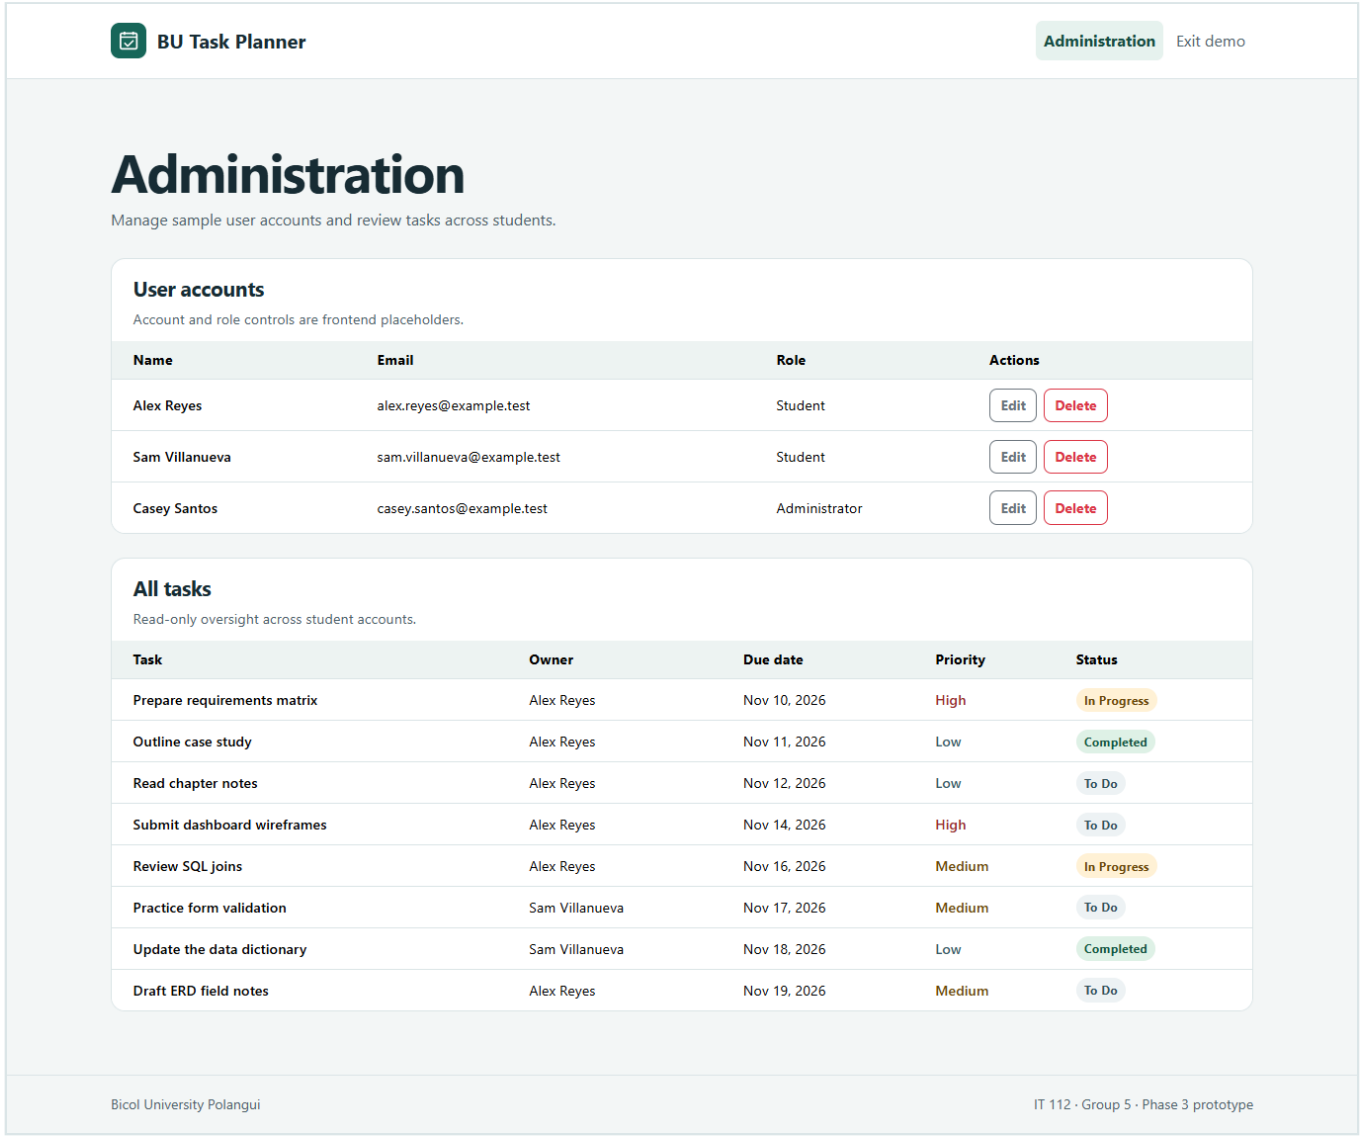

Review the student account

Name and email map to Users.name and Users.email. The account summary displays role and join date as read-only information.

Administration

frontend/admin.html

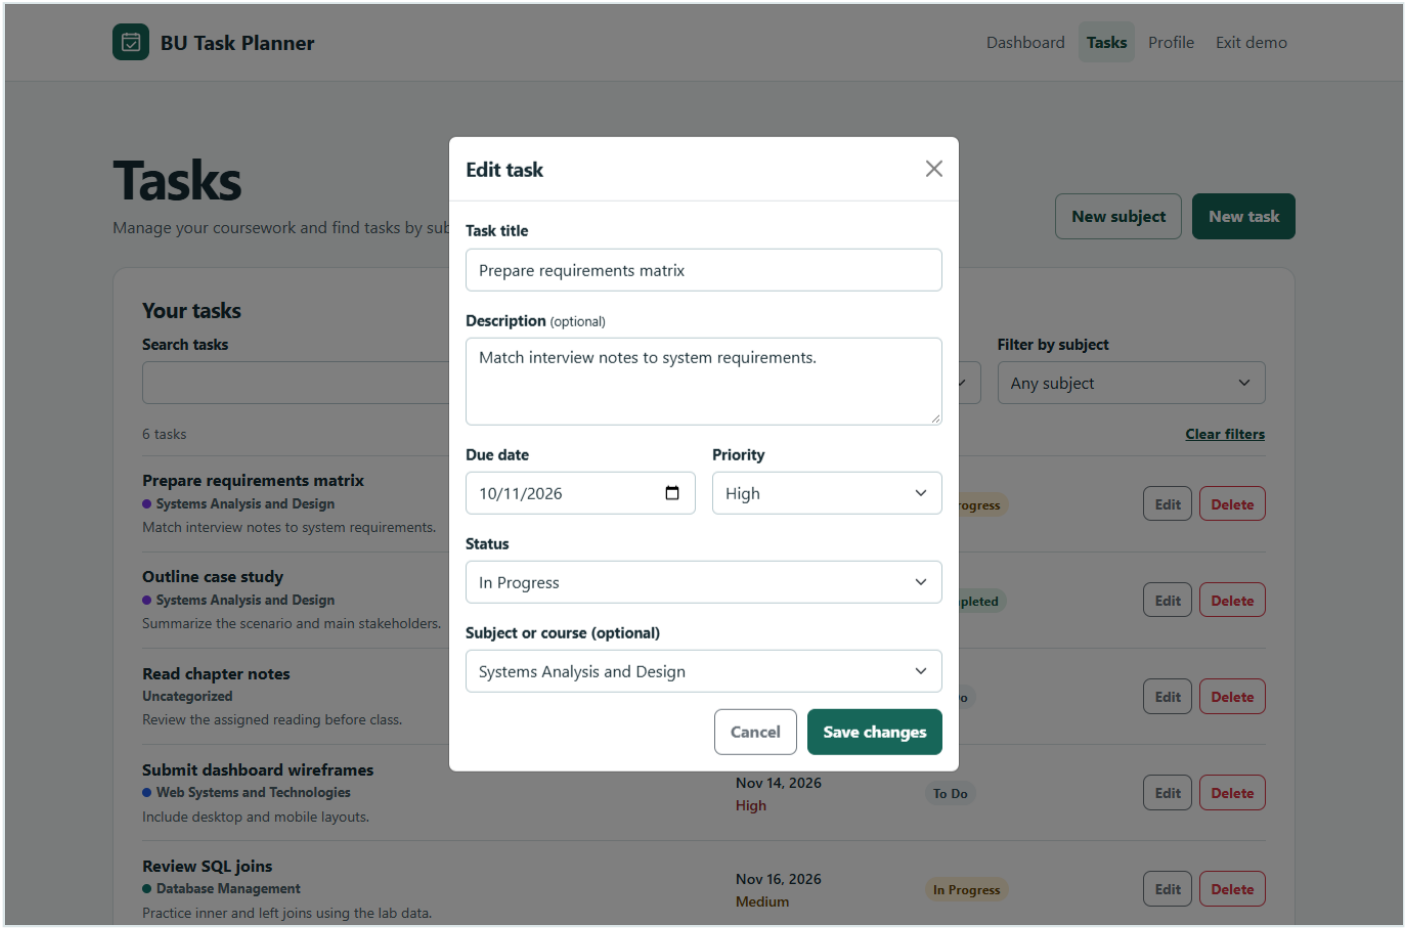

Manage accounts and oversee all tasks

The account table shows name, email, and role. Edit and delete dialogs carry the record ID. The oversight table shows sample tasks from multiple student owners.

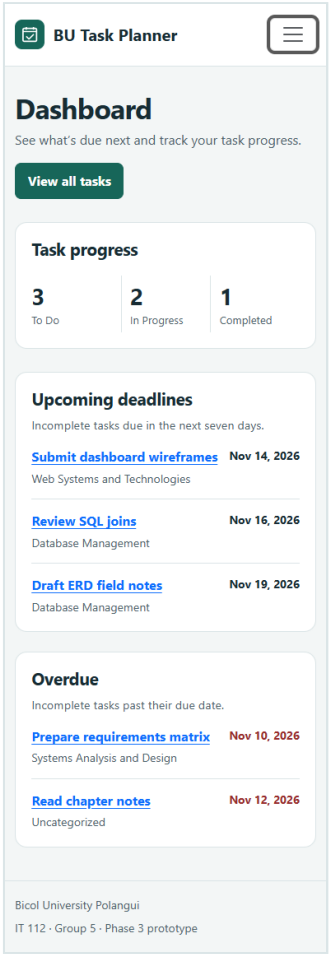

Edit task and mobile layout

Additional evidence for task field mapping and responsive navigation.

Edit task placeholder

The dialog preloads the selected task. It includes title, description, due date, priority, status, and optional subject. Submitting displays a preview message.

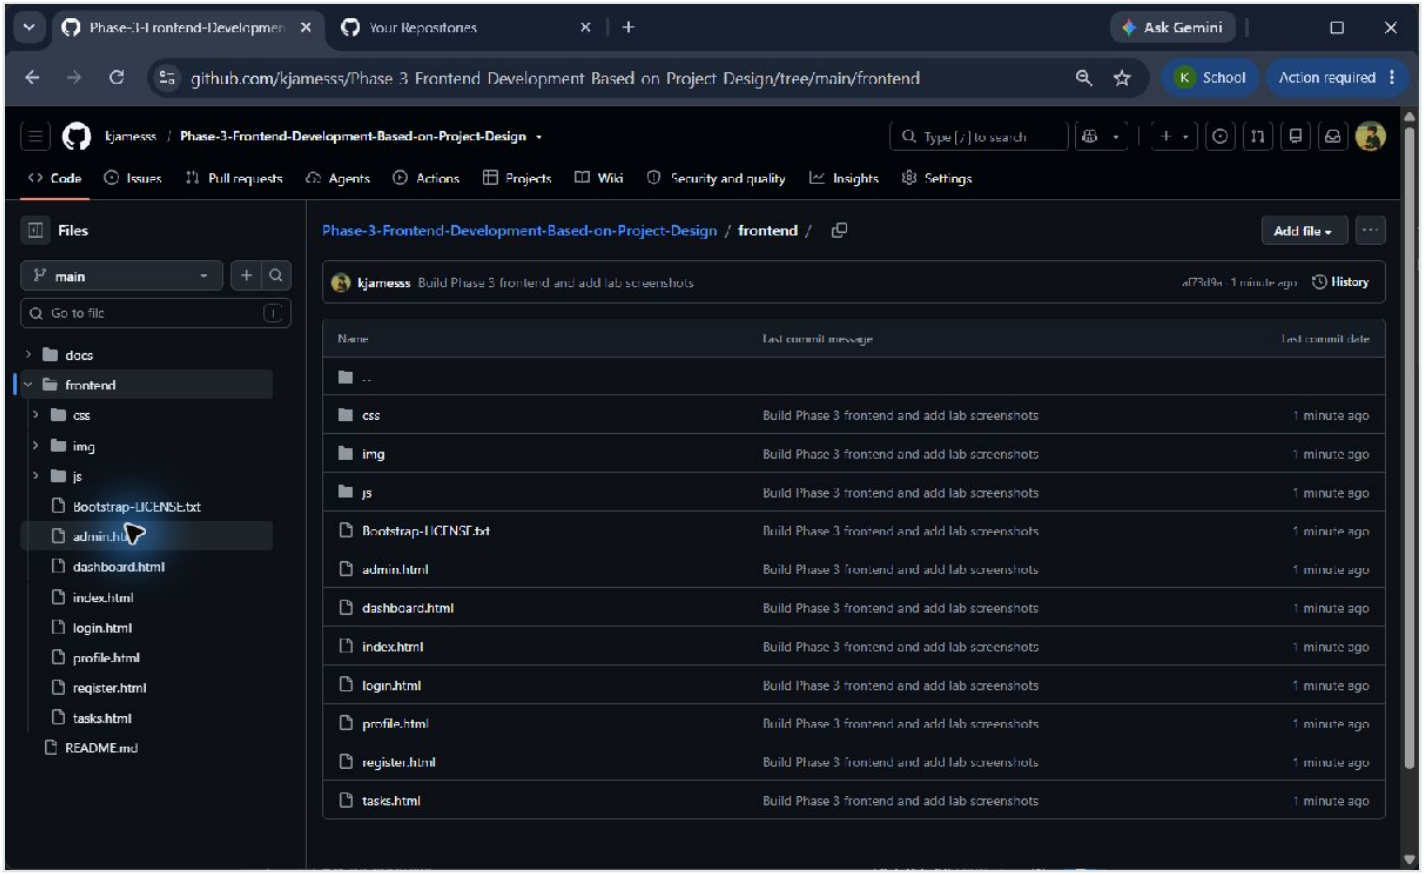

Mobile dashboard

The deadline cards stack and the navbar collapses.

Repository and commits

Individual reflections

Group 5

Bea Roshan O. Pabilona

Project Manager and Documentation Officer

I learned to turn the Phase 1 diagrams into a checklist for the frontend. The checklist made it easier to connect each screenshot to a student or administrator use case. In the next phase, I would use the same checklist to track which actions are ready for API testing.

Christian A. Balauro

Backend Developer / Back End-Manager

The form previews helped me see what the Express routes will need to accept. The edit and delete dialogs made it clear that the server will need a record ID and an ownership or role check. For integration, I would start with authentication and then test what happens when a user tries to access a task they do not own.

Karl James Matias

GitHub Manager

A consistent folder structure makes the frontend, screenshots, and report easier to find in GitHub. I learned why focused commit messages make it easier to trace the code and documentation changes. For the next phase, I would review the branch history before merging integration work.

Eleanor Aimee O. Reantaso

Front-End Developer / Front-End Manager

This phase showed me how a shared navbar and consistent form layout make separate pages feel like one application. I saw how much room the task filters and action buttons need when the layout becomes narrow. I would carry the same layout into the next phase and add feedback for API errors.

Simranjit S. Singh

Database Manager

Mapping the screens to the ERD helped me see which values users supply and which values the database layer manages. The optional subject field is a good example because a task must still be valid without a category reference. In the next phase, I would verify that the allowed status and priority values match the Mongoose schema.
